Why compare inside Delhi NCR?

Outside Delhi NCR, Zomato listed only about 20 popular restaurants per city. All of them are rated, so they average 3.94 stars vs 3.28 in Delhi NCR.

That gap comes from how the data was collected, not from food quality. Fair comparisons are only possible within Delhi NCR.

Inside Delhi NCR, malls and business hubs lead: Cyber Hub, DLF Mall of India, Sector 29 Gurgaon and Khan Market.

Key Insights

About the Data

1. Delivery = visibility, not quality

96% vs 67%

Restaurants on online delivery are far more likely to be rated (96% vs 67%) and get more votes (median 77 vs 13), but their average rating is almost the same (3.37 vs 3.34).

2. Price helps, moderately

3.20 → 3.73

Average rating rises from 3.20 (budget) to 3.73 (luxury). The link is only moderate (correlation 0.33), so cheap restaurants can still rate well.

3. Popularity and rating move together

2.96 → 4.11

Restaurants with 10 or fewer votes average 2.96; those with 1,000+ votes average 4.11. Votes have the strongest link to rating (correlation 0.65).

4. International cuisines rate highest

3.98

Mediterranean (3.98), European (3.91) and Asian (3.85) lead. Mithai, Pizza and South Indian rate below the 3.35 average. Part of this gap is price.

5. Location matters inside Delhi NCR

3.86

Malls and business hubs have the best-rated restaurants: Cyber Hub (3.86), DLF Mall of India (3.84) and Khan Market (3.80), vs a 3.28 NCR average.

6. Table booking is a price signal

3.55 vs 3.31

Restaurants with table booking rate higher, but booking is mostly offered by premium and luxury places. The difference is largely a price effect.

Recommendations for a new restaurant

- List on online delivery from day one to build reviews and visibility quickly.
- Prefer a mall or business-hub location (Cyber Hub, Khan Market, Connaught Place) where ratings run highest.
- Consider an under-served, high-rated cuisine such as Mediterranean or Asian rather than another North Indian outlet.
- Focus early effort on collecting reviews: well-reviewed restaurants attract more diners and more votes.

Limitations: a 2019 snapshot, uneven city coverage, and correlations only. None of these findings prove cause and effect.

Data source

- Kaggle: "Zomato Restaurants Data" (Shruti Mehta), a snapshot from around 2019.
- Raw file: 9,551 restaurants × 21 columns across 15 countries.
- This project uses the 8,652 restaurants in India (91% of the file).

Data model (Power BI)

- Star schema: Restaurants fact table with City, Price Range, Cost Band and Cuisine lookup tables.
- Restaurant–cuisine bridge table (one row per restaurant per cuisine), filtering in both directions.
- 30+ DAX measures, kept together in a _Measures table.

Limitations

- Delhi NCR is 92% of the data; other cities have only ~20 popular restaurants each, so cross-city comparisons are biased.
- A single snapshot: no trends over time.
- Findings show correlation, not cause and effect.
- 496 restaurants have missing map coordinates, so no map is shown.

Cleaning steps (Python, pandas)

- Loaded with latin-1 encoding (the file is not UTF-8).
- Filtered to India and kept 14 useful columns; no duplicate restaurants found.
- 2,139 restaurants had a rating of 0, meaning "not rated". Set to blank so they do not drag averages down (2.52 → 3.35).
- 9 restaurants had a cost for two of ₹0. Set to blank. 5-star hotel prices up to ₹8,000 kept as genuine.
- Merged twin cities: Secunderabad → Hyderabad; Panchkula and Mohali → Chandigarh.

Coverage Check: why cities outside Delhi NCR look better

Region	Restaurants	Rated %	Avg Rating	Median Votes
Delhi NCR	7,947	73.1%	3.28	19
Other cities	705	100.0%	3.94	191
Total	8,652	75.3%	3.35	24
